FLAG OF THE DAY

FOTD #11

The Interpreter

CATEGORY	Reverse Engineering / Binary Analysis
DIFFICULTY	Hard
DATE	27/09/2026
FLAG FORMAT	INFOSEC_SIG{...}
ATTACHMENT	vm_crackme

DESCRIPTION

We found this on a decommissioned lab machine. No source, no comments, just a binary.

Run it and it asks you for a flag. Get it wrong and it just says “nope” — no hints, no error messages, nothing leaked at runtime. Whatever is checking your input isn't ordinary C logic; it behaves more like its own tiny language, interpreting some kind of program to decide whether you're right.

Pull it apart, understand what it's actually executing, and work out what input makes it say “correct.”

Binary: x86-64, Linux, stripped. Runs standalone, no arguments, no network access needed.
